

AGS Facilities ensures data recovery in a fast-paced environment with **Acronis**

Growing company embraces Acronis Cyber Protect for remote accessibility.

French company AGS Facilities is a rapidly expanding facility management company that recently began operating as an independent company. It manages a wide range of complex activities and services for clients, including breakdown assistance, maintenance and inspections, enabling clients to concentrate on their core businesses.

THE SOLUTION

A service provider suggested Acronis. The backup solution in Acronis Cyber Protect met the company's need for a more secure, flexible and efficient data recovery system.

THE IMPACT

- AGS Facilities gained the ability to perform backups and restore files on a server not located in the same location as its primary server.
- Logs provided better insight into backup processes and enabled the company to prevent and correct errors.
- Acronis Cyber Protect offered accessibility from anywhere, improving operational flexibility.

KEY CHALLENGES

- Unintentional errors or data deletions had the potential to be common occurrences in a fast-paced environment.
- The prior solution was slow and produced frequent errors, often without logs to diagnose issues.
- The previous backup method lacked differential or incremental backup solutions, making data recovery less efficient.
- Storing backups on a server located in the same physical place as the company's primary servers was risky.

KEY REQUIREMENTS

- A flexible and fast method to recover data quickly after errors or accidental deletions.
- A solution that could overcome the slowness and frequent errors of the company's previous system.
- A backup system that provided logs to help diagnose and resolve issues.
- Differential or incremental backup options to optimize backup processes.

The solution provider who suggested Acronis Cyber Protect had been using the platform and was satisfied with it.
